

Abstract of the Disclosure:

A juicer has a tilting collecting dish that permits simple, loss-free pouring out of the fruit juice. It is unnecessary to remove the squeeze element with which the citrus fruit was pressed and/or the collecting container surrounding the squeeze element, from which the fruit juice drops into the collecting dish. In order to tilt the collecting dish, two opposing projections are provided on the outer side of the jacket wall thereof, which lie rotatably or pivotally in recesses on the inside of the housing wall.
